↳

:

static ptr → ~~main structure~~.

ft_global.

ptr to env,

ptr to sh

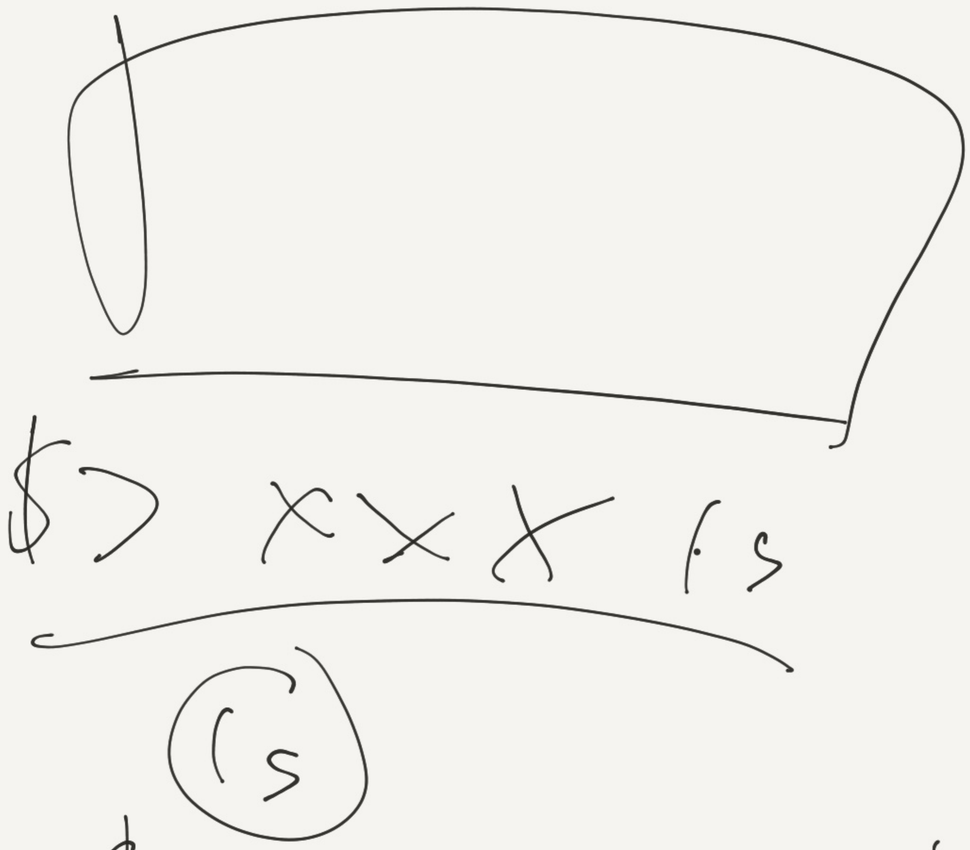

Termcaps

↳ line editor.

save pos at cursor

Vertical & horizontal

loop & start shell

$>

1. malloc
2. load fc
3. initbuff write
4. getinput
5. lexer
6. parser
7. browse btree.

fork & browse btree.

execve ("ls")

& when u start browsing fork.

loop on each command

1. split on ";"
2. Trim
3. ~~Loop~~ on (1)
4. AST create
5. Term
   normal mode
6. browse tree
7. free tree

done

1. init
- malloc struct
- buffer

↳ main loop
→ input -> enter
→ add_history
→ parse

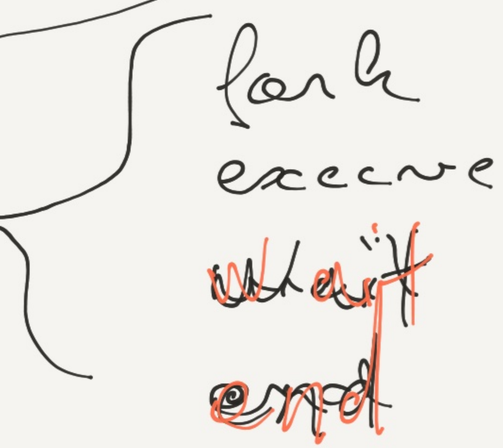

FT_parser = (lexer + parser)

1 Fork

2 check operation (array of Func)

3. Depending on operation
   ↳ manage File Description

4. Browse recursively
   if end → execute

DO NOT (after AST)
FORK !

↳ builtin

no need binary

functions
↳ cd
echo
env
exit
export
unset env
